Jandao Takedown Bow Manual

Takedown Bow Parts & Setup

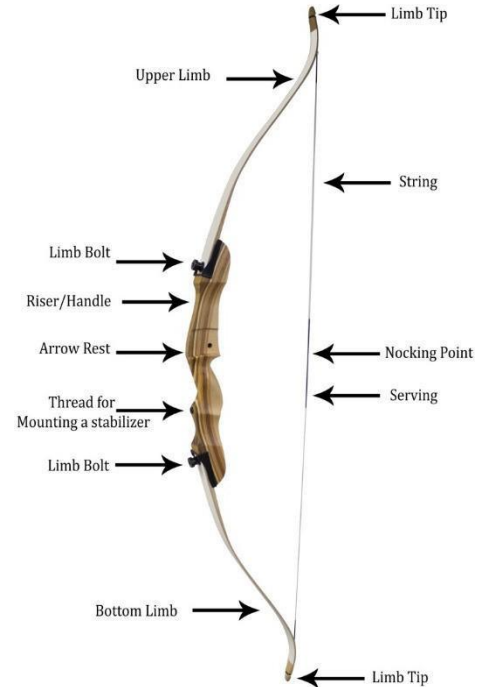

First things first. You need to make sure that you locate all of the contents for your Jandao Takedown Bow. You should have 1 riser, 2 limbs, 2 bolts, and a string. You will either have a 62" model with a 58" string, or a 54" bow with a 50" string. In order to get started, you need to hold the riser in your hand so that you can determine which side is up. Once you have that situated, you should place the limbs on the bow. The bottom limb will be labeled "lower limb." Place the limb in the grooves of the riser and fasten the limb bolt. Repeat this process for the top limb. **VERY IMPORTANT:** Do not over-tighten the limb bolts because this may cause limb damage.

Stringing the Jandao Bow

While there are many ways that one would string a bow, we believe that the safest method involves the use of a bow stringer (sold separately). Using the step-through method might cause your limbs to become twisted and the risk of injury is high. When you are stringing your Jandao Takedown Bow, you want to make sure that piece of the bowstring with the smaller loop is placed on the bottom limb first. This will ensure an optimal fit. Figure 1 represents this process graphically.

Bow Maintenance & Safety

- You should always make sure that you unstringing your Jandao Takedown Bow when it is not being used
- Make sure to store your takedown bow in a cool, dry place when not in use
- Shooters rule applies; Never aim or draw at anything that you do not plan to shoot.
- Never draw back your takedown bow without an arrow that is properly nocked. If you release the bow in this manner you will cause a dry fire.
- Dry firing your Jandao Takedown Bow is dangerous, it can severely damage your bow and will void any warranty.

Step 1

The first thing you should do with your Spirit Takedown bow is to attach the bottom limb to the riser. The bottom limb has the weight markings on it. Once this is done, put the top limb on in the same fashion.

Step 2

Next, you should begin to place the string on the bow. You should set the smaller bottom loop on the limb and the larger loop should hang on the top.

Make sure to slip your stringer (closed rubber portion facing you) on your bottom limb first since the string is already in the notch. Then do the same for the top limb. You should position the stringer between the handle riser and the bowstring as close to the bowstring as possible to avoid injury. Below is a picture of what the bow should look like before as you set up to use the stringer.

**Notes: Stringer is optional and sold separately.*

Step 4

Stand on the center of the bow with both feet on the bowstringer. Slowly pull the riser up towards you with one hand. Use your free hand to position the string into the string groove on the top limb. Gently rerelease the pressure and check that the loops are in properly in the grooves before relieving all tension.
